Hu et al. published a brief overview of different proppant types and amounts used in stimulation designs in the Bakken shale play between 2011 and 2013. The results are based on four case studies that focused on 72 wells in four different fields and the production rates were compared based on the 270 day production data.

An extensive and wide-ranging literature about the polymorphs of titanium dioxide (TiO₂) has accumulated during the last few decades, providing a very large resource of data on its properties, functionality and many present and potential industrial uses. This review focuses on the structural, kinetic, thermodynamic and electrical properties of TiO₂ from the viewpoint of the relationship ...

The electron is a subatomic particle, symbol e^- or β^- , whose electric charge is negative one elementary charge. Electrons belong to the first generation of the lepton particle family, and are generally thought to be elementary particles because they have no known components or substructure. The electron has a mass that is approximately 1/1836 that of the proton.
