The marginals for each variable are on the outer edge of the table. If we were to pick the best configuration using only the individual marginals then we would pick $x=1$ (0.7) and $y=0$ (0.9), giving a probability of $P(x=1, y=0) = 0.4$.

4 Suppose a 1 KHz detection bandwidth is desired for a 7 MHz receiver. If R_{sys} is 50 ohms, and both R and R_{switch} are assumed to be zero, a detection C of 1.33 μf yields a 3 db lowpass filter bandwidth of 1 KHz.

I want to write a function in Python that returns different fixed values based on the value of an input index. In other languages I would use a switch or case statement, but Python does not appear to have a switch statement. What are the recommended Python solutions in this scenario?

Box and Cox (1964) developed the transformation. Estimation of any Box-Cox parameters is by maximum likelihood. Box and Cox (1964) offered an example in which the data had the form of survival times but the underlying biological structure was of hazard rates, and the transformation identified this.

In an electric power system, switchgear is the combination of electrical disconnect switches, fuses or circuit breakers used to control, protect and isolate electrical equipment. Switchgear is used both to de-energize equipment to allow work to be done and to clear faults downstream. This type of equipment is directly linked to the reliability of the electricity supply.

A residual-current device (RCD), or residual-current circuit breaker (RCCB), is a device that instantly breaks an electric circuit to prevent serious harm from an ongoing electric shock. Injury may still occur in some cases, for example if a human falls after receiving a shock. In the United States and Canada, the device is called a ground fault circuit interrupter (GFCI), ground fault ...
